TASK – 2 OF MOTIONCUT INTERNSHIP

User Registration Form

1. The task is to create a user- friendly dynamic Registration form using html and css.
2. By considering the input conditions that are given I have created a web page using html and css for the registration form.
3. The parameters that I have considered for the registration process is Username , Email and password.
4. It also only a submit button which will get activated inly when all the three factors are filled with their respective values. Even if one of the parameter has not been filled then it will display a note that the parameter has not been filled.
5. The user has the freedom of choosing their own username.
6. When the Gmail has been written it should maintain some format for example the Gmail will only be considered when it has @gmail.com.
7. Example: 123@gmail.com is accepted but 123 is not accepted.
8. The user has the freedom of choosing their own password and once all the details the filled if they click on the submit it will redirect to an another page.
9. Where it will display that the user has logged in successfully and when I have also created an option as log out.
10. By clicking on that then the page will again redirect to the starting web page where he ahs to again login.
11. I have used meta property for making the code adjustable according to the screen size.
12. I have made use of various CSS properties such as color, background- image, font-family ,etc… to make the web site visually appealing.
